Final review contains 2 modules consists of  
different topics

Module 1: consists review 1 presentation

Module 2: consists review 2 presentation

# INTRODUCTION TO MODULE 1

**Inn refers to .....**

**The term "inn" historically characterized a rural hotel which provided lodging, food and refreshments, and accommodations for travelers' horses.**

**Inn managements are responsible for managing employees and for planning, marketing , coordinating and administering lodging and dining services such as catering and accommodation facilities.**

**“The main aim of introducing an inn management system is to make the customer free to select their requirements by providing multiple options like booking dining slot to dine in the inn or customer can book the accommodation with their requirements that deals with both management and customer registration and billing, and for management prices editing for their choice of lodging or dining facilities. “**

**this project is to give the program access to both the management and the customers this project include two types of users**

### **User1 “employ”**

**1.)Employ can use this program to edit the prices of both dining and lodging multiple times.**

**2.)Employ access the benefits of user 1 called “employ” require security permission before he enters to the user called “employ” blog.**

### **User 2 “customer”**

**1.)customers will have so many benefits to choose the facilities provided by the “9 decades grand inn” like the type of room, type of environment condition, dining, type of food, etc.**

**2.)customers get the final bill for which they selected in the user 2 blogs.**

**There are two types of research procedure**

**logical research ?**

**Regarding rates and type of rooms provided and type of food provided etc.**

**Technical research ?**

**collecting textbooks related to the basics of c language from the internet to get technical support to write the c program and from library books.**

<b>Operating system</b>	<b>windows 7,9,10, ubuntu, IOS</b>
<b>Memory</b>	<b>4 GB ram or more</b>
<b>IDE</b>	<b>Online C compiler</b>
<b>Programming language</b>	<b>C language</b>
<b>Hard disk space</b>	<b>Minimum 128 GB data usage</b>

# MODULE 2

# Introduction to module 2

01

Inn management  
system  
(mini project)  
Algorithm

02

Code  
for  
Inn management  
system

03

Design of  
program  
Management of  
program

# **1. Algorithm for Inn management system (Mini project)**

**Step 1: start**

**Step 2: print the introduction of inn**

**Step 3: declaration of goto function by the name intro:**

**Step 4: input by user to his choice customer and employee by 1 and 2 numerical**

**Step 5: if input is 2 or user is 2**

**Step 6: calling function opens employlogin () {(control transfer to called function)}**

**Step7: if input is 1 or user is 1 customer blog opens**

**Step8: input customer name**

**Step9: input mobile number**

## **Algorithm 2:**

**(Starts after the input 1 in user choice called lodging)**

**Step1: start**

**Step2: control transfer to case 1**

**Step3: input type of room user choice 1 or 2**

**Step 4: input type of room condition user choice 1 or 2**

**Step5: input number of rooms**

**Step6: input user choice (dinning or lodging) 1 or 2**

**Step7: if food is 1 or dining is user choice**

**Step8: input type of food 1or 2**

**Step9: input user choice size 1 or 2**

**Step10: input members dine**

## **Employlogin ():**

**Step1: start**

**Step 2: input name of employee**

**Step3: input password**

**Step4: if password is 9999**

**Step5: input edited prices of customer choices**

**Step6: else password is rather than 9999**

**Step7: output “login failed wrong password”**

**Step8: control transfer to main function starts from  
where the control transferred to subfunction**

**Step9: end**

## **Bill ():**

**Step1: output of introduction of bill function**

**Step2: output customer name**

**Step3: output mobile number**

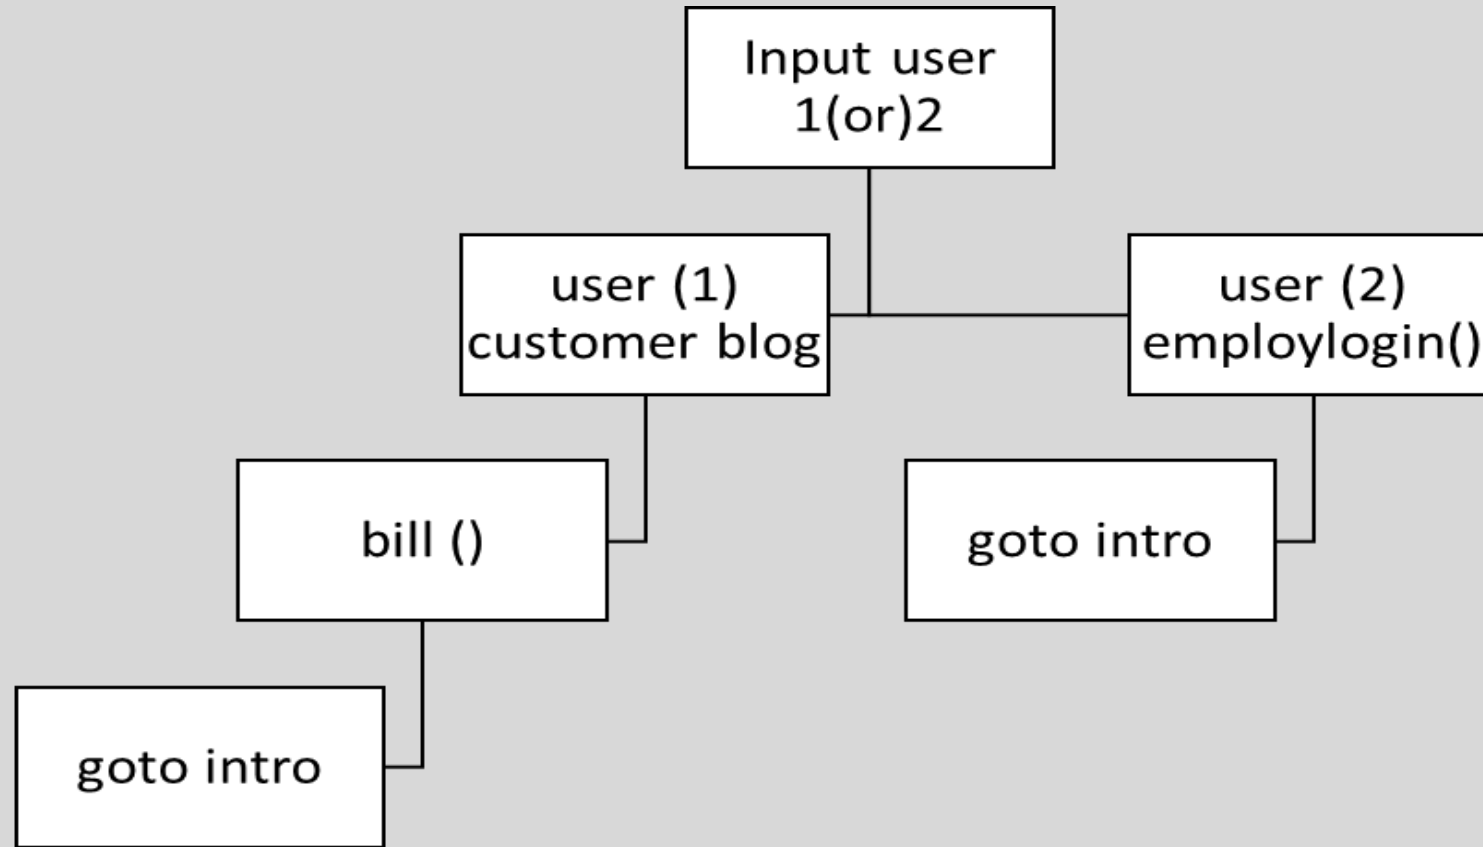

**Step4: output of amount customer should pay**

**Step5: output welcome details**

**Step6: control transfer to main function starts from  
where the control transferred to subfunction**

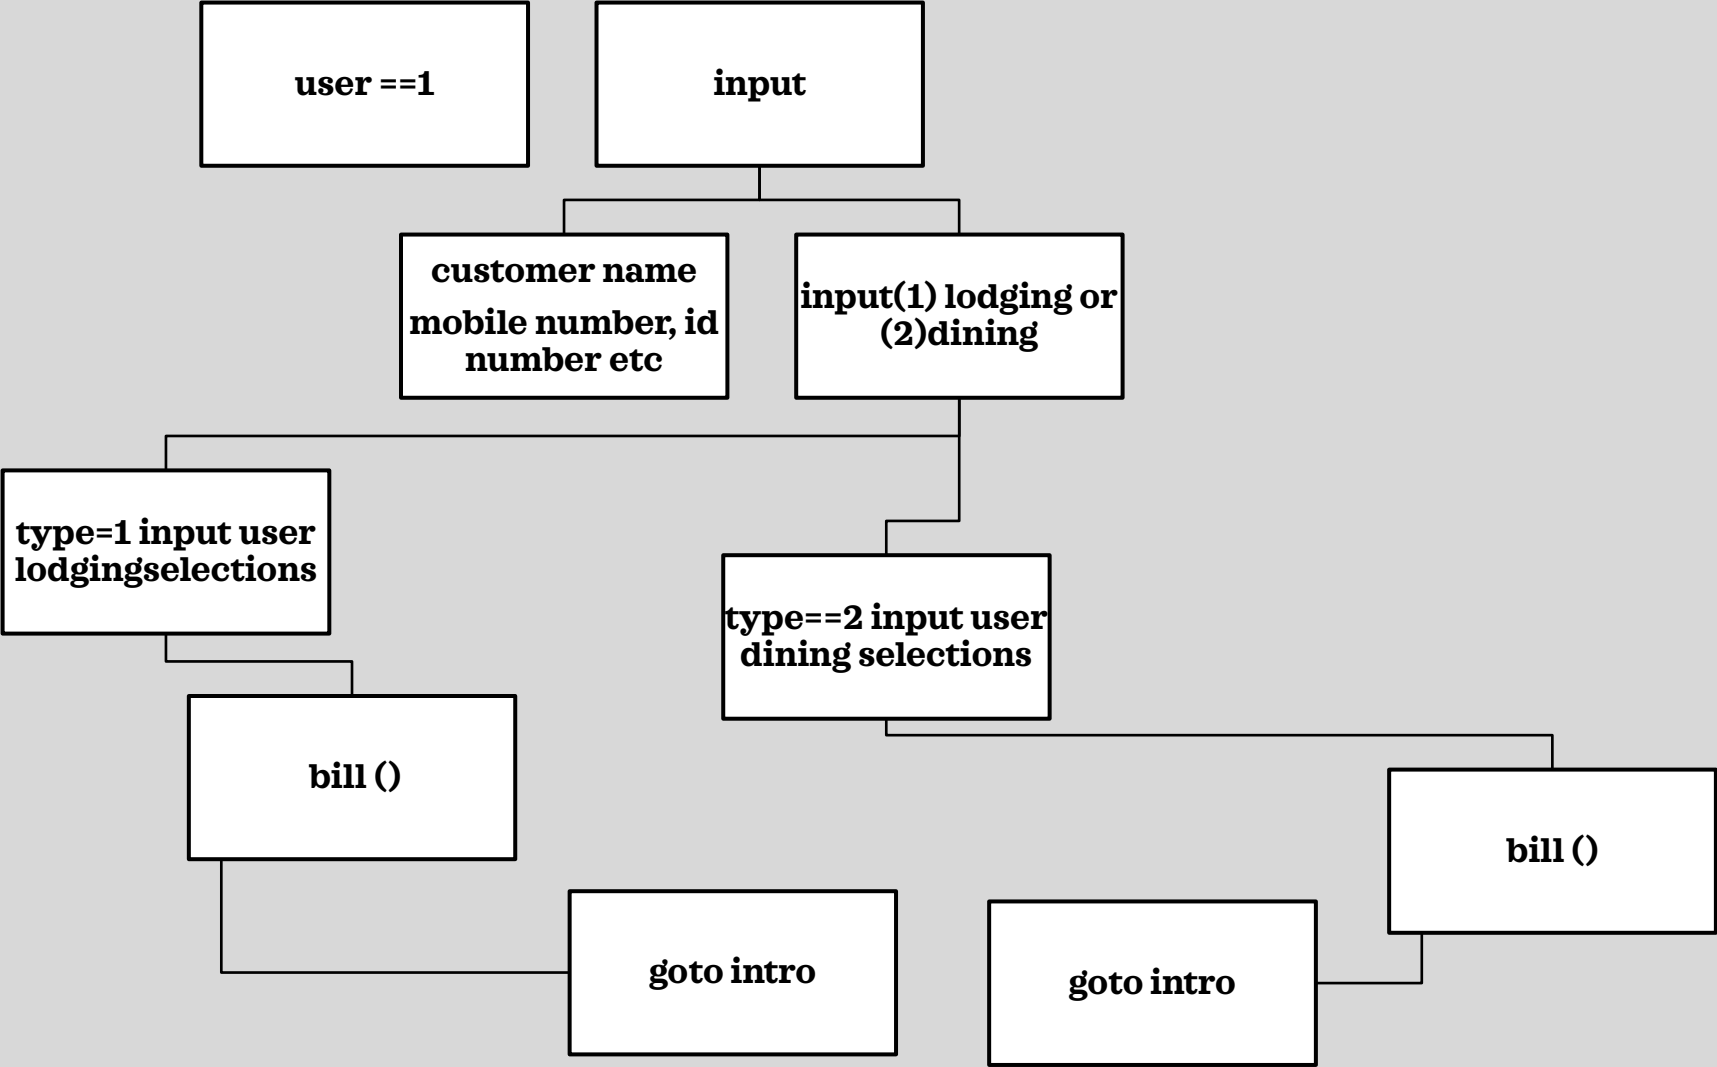

**Step7: end**

## Block diagram for inn management system

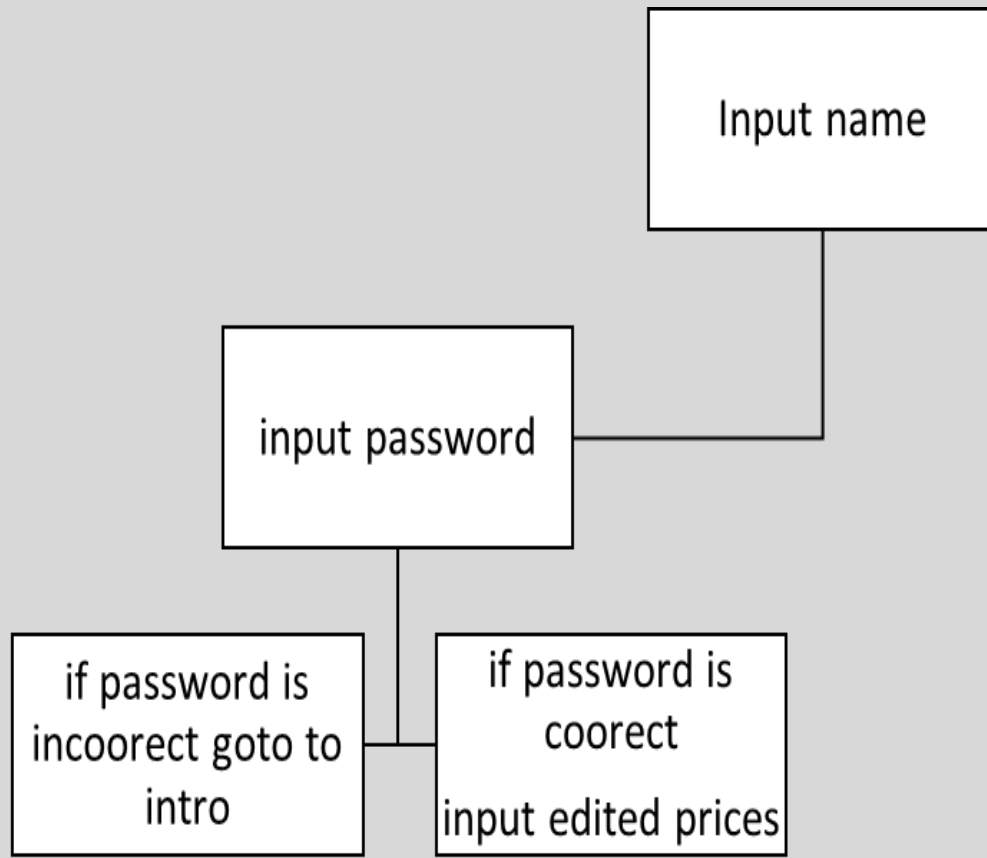

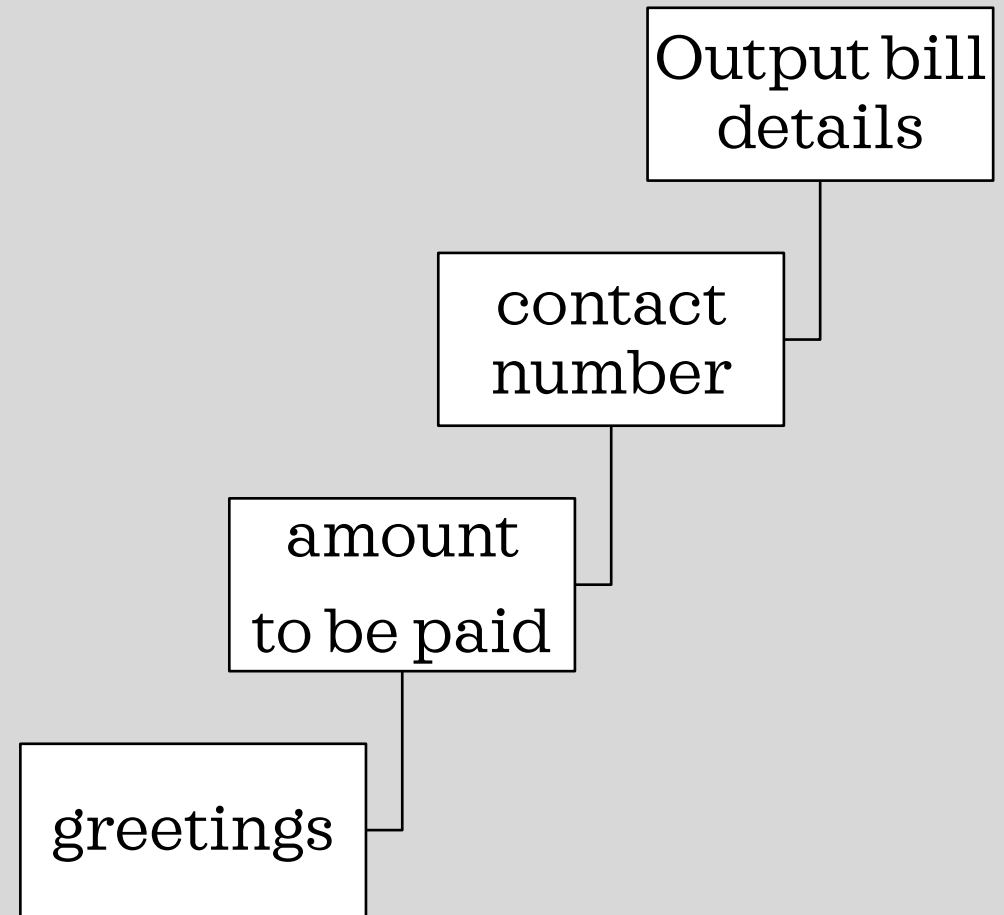

# Customer blog

## Employlogin()

## Bill ( )

**Design implementation**

Declaration of global variables and sub functions related to rates and type of rooms and type of food etc.

```
#include<stdio.h>
void employlogin();
void bill();
char name,id,size,typeofroom;
int number,idnum,type,rooms,count,sum=0,password=9999,tables,user,food,typeoffood,typeofcondition;
int ac_deluxe = 3000, ac_super_deluxe = 6000, non_ac_deluxe = 2500, non_ac_super_deluxe = 3500, cost_of_food = 2000;
```

“Intro” is the label for goto statement if the goto statement added to function then the control transfer to intro

```
intro: printf("\t\t\twelcome to 9 decades grand inn\n");
printf("\nenter user type(1.customer or 2.employ)press 1 or 2 :");
scanf("%d",&user);
```

```
if(user==2)
{
    employlogin();
    goto intro;
}
```

From the user input program splits into two categories one is customer and employee By input 1 and 2 here conditional statements shift the control to user type

→(The if statement allows you to control if a program enters a section of code or not based on whether a given condition is true or false. ... One of the important functions of the if statement is that it allows the program to select an action based upon the user's input.)

```
if(user==1)
{
    printf("customer name  :");
    scanf("%s", &name);
    printf("mobile number  :");
    scanf("%d", &number);
    printf("ID card type   :");
    scanf("%s", &id);
    printf("ID number      :");
    scanf("%d", &idnum);
}
```

→(A switch statement is a conditional statement used in C programming to check the value of a variable and compare it with all the cases.)

```
printf("1.lodging\n2.dinning ");
printf("\nselect from one of this :");
scanf("%d", &type);
switch (type) {
    case 1 :
```

→(Each value is called a case, and the variable being switched on is checked for each switch case.)

```
case 1 :
    printf("type of room(1.deluxe or 2.super deluxe)press 1 or 2 :");
    scanf("%d",&typeofroom);
    printf("(1.ac or 2.non ac) press 1 or 2 :");
    scanf("%d", &typeofcondition);
    printf("number of rooms :");
    scanf("%d", &rooms);
    printf("(1.dining or 2.without_dining) press 1 or 2:");
    scanf("%d", &food);
    if (food == 1) {
        printf("1.veg or 2.non veg press 1 or 2 :");
        scanf("%d", &typeoffood);
        printf("limited or unlimited      :");
        scanf("%s", &size);
        printf("total members dining      :");
        scanf("%d", &count);
    }
```

→(In switch case 1 this includes price for selected choice like each conditional statements consists of different combinations of customer selections of dining and lodging )

```
if (typeofroom ==1 && typeofcondition==1) {
    printf("cost of %d deluxe AC rooms      :%d*%d", rooms, rooms, ac_deluxe);
    printf("\ncost of dining for %d members :%d*%d", count, count, cost_of_food);
    sum = (ac_deluxe*rooms) + (cost_of_food * count);
    bill();
    goto intro;
}
if (typeofroom ==1 && typeofcondition==2) {
    printf("cost of %d deluxe non ac rooms      :%d*%d", rooms, rooms, non_ac_deluxe);
    printf("\ncost of dining for %d members      :%d*%d", count, count, cost_of_food);
    sum = (non_ac_deluxe*rooms) + (cost_of_food * count);
    bill();
    goto intro;
}
if (typeofroom ==2 && typeofcondition==2) {
    printf("cost of %d super deluxe non ac rooms :%d*%d", rooms, rooms, non_ac_super_deluxe);
    printf("\ncost of dining for %d members      :%d*%d", count, count, cost_of_food);
    sum = (non_ac_super_deluxe*rooms) + (cost_of_food * count);
    bill();
    goto intro;
}
if (typeofroom ==2 && typeofcondition==1) {
    printf("cost of %d super deluxe ac rooms      :%d*%d", rooms, rooms, ac_super_deluxe);
    printf("\ncost of dining for %d members      :%d*%d", count, count, cost_of_food);
    sum = (ac_super_deluxe*rooms) + (cost_of_food * count);
    bill();
    goto intro;
}
```

→(Else conditional statements consists of nested if to give combinations of prices of user selection of only lodging)

```
else {
    if (food ==2) {
        if (typeofroom ==1 && typeofcondition==1) {
            printf("cost of %d deluxe AC rooms :%d*%d\n", rooms, rooms, ac_deluxe);
            sum = rooms*ac_deluxe;
            bill();
            goto intro;
        }
        if (typeofroom ==1 && typeofcondition==2) {
            printf("cost of %d deluxe non ac rooms :%d*%d\n", rooms, rooms, non_ac_deluxe);
            sum = rooms*non_ac_deluxe;
            bill();
            goto intro;
        }
        if (typeofroom ==2 && typeofcondition==2) {
            printf("cost of %d super deluxe non ac rooms :%d*%d\n", rooms, rooms, non_ac_super_deluxe);
            sum =rooms* non_ac_super_deluxe;
            bill();
            goto intro;
        }
        if (typeofroom ==2 && typeofcondition==1) {
            printf("cost of %d super 2deluxe ac rooms :%d*%d\n", rooms, rooms, ac_super_deluxe);
            sum = rooms*ac_super_deluxe;
            bill();
            goto intro;
        }
    }
}
```

```

        break;
    case 2:
        printf("(1.veg or 2.nonveg) press 1or 2  :");
        scanf("%d", &typeoffood);
        printf("limited or unlimited      :");
        scanf("%s", &size);
        printf("total members dining      :");
        scanf("%d", &count);
        printf("reservation of tables count  :");
        scanf("%d",&tables);
        printf("you table is reserved");
        printf("\ncost of dining for %d members :%d*%d", count, count, cost_of_food);
        sum=count*cost_of_food;
        bill();
        goto intro;
    }
}
return (0);
}

```

→(in this module switch case 2 consists of customer input related to only dining facility here, the prices even be displayed in bill subfunctions. )

→(Here employlogin () is subfunction consists of user input related rate fixation of different categories of customer selection)

```
129 void employlogin()
130 {
131     printf("enter password :");
132     scanf("%d",&password);
133     if(password==9999)
134     {
135         printf("edit price of ac deluxe      :");
136         scanf("%d", &ac_deluxe);
137         printf("edit price of ac super deluxe  :");
138         scanf("%d", &ac_super_deluxe);
139         printf("edit price of non ac deluxe      :");
140         scanf("%d", &non_ac_super_deluxe);
141         printf("edit price of non ac super deluxe :");
142         scanf("%d", &non_ac_super_deluxe);
143         printf("edit price of dining          :");
144         scanf("%d", &cost_of_food);
145         printf("\n\n");
146     }
147 }
148 else {
149     printf("login failed wrong password");
150 }
151 }
152 }
```

→(here bill () is totally a output subfunction which consists of bill details like amount to be paid. The function is used in all conditional statements and even in switch cases it's a important function in this project .)

```
150 void bill(){
151     printf("\nbill details :");
152     printf("\ncontact number :%d",number);
153     printf("\ntotal amount should be paid  :%d/-",sum);
154     printf("\n\t\t\tthanks for choosing to 9 decades grand inn\n");
155 }
```

# RESULTS FOR VARIOUS INPUTS BY USER
